

Multi-Part Standard Proposal (KR)

Korea proposes to have the following specifications to be specified in separate Parts where each Part has its own Scope and Conformance clause.

1. WordprocessingML
2. SpreadsheetML
3. PresentationML
4. DrawingML

In this proposal, DrawingML needs to be separated otherwise it would be duplicated in WordprocessingML, SpreadsheetML, and PresentationML.

Rationale behind this multi-parts specification is to promote the openness, interoperability, and extensibility of DIS29500 and also to ease the maintenance activities by allowing independent, asynchronous and modularized activities. The size of the separated parts matters, but is not crucial.

We believe that this initial separation is stepping stone towards the configuration with modularized components and open integration framework that allows interoperability and extensibility.

Note: In this proposal, Korea does not ask separation of schema according the above separation. The schema as a whole body of text may be placed as an annex in other separated Part.

Note: These specification are already grouped in separated sections in Part 4
